

# Open Machine

A friendly computer whose structure is visible—and whose contents invite children to **play, open, and change** them.

# One identity. Three surfaces.

## LIBRARY

### Familiar front door

Large visual cartridges, immediate play, low density, and one obvious route into making.

- Primary card action: PLAY
- Secondary action: CHANGE
- Pinned MAKE entry
- Library is Home

## STUDIO

### Productive workspace

A precise desktop/workbench with real projects, tabs, files, tools, undo, saving, and playtesting.

- One tabbed Make/Editor app
- Config → Blocks → Code → art
- Editor beside playtest on P4
- Fullscreen tabs on T-Deck

## PLAYER

### The cartridge owns the screen

Play is a black-box run-and-return action. Moybyte does not decorate or normalize the child's game while it runs.

- Fullscreen from Library
- Windowed playtest from Studio
- Exit returns to the caller
- No shell chrome over games

Use the Library to invite them in. Use Studio to turn them into makers.

# Identity direction · Open Machine

Relationship reference: dark construction field + warm-light tools + grape Moy

**CONCEPT REFERENCE** Use the visual relationships, not every generated object or control.

# Library · familiar, visual, immediate

Large targets and rich cartridge art inside the same precision-pixel OS

**OVERRIDES** EDIT → CHANGE · remove Favorites/New/Options · no bottom nav · Settings appears once, upper-right

# Studio · a real computer opens underneath

Precision-pixel desktop; one tabbed Editor plus a separate playtest

**OVERRIDES** No fake Trash/meters/menu commands · no independent Code/Map/Sprites processes

# See it. Play it. Open it. Change it.

**Play is the doorway.** Making is what the room is built for.

## MAKE

The pinned MAKE tile opens the project picker. New, Copy, and Delete live there—not on the Library shelf.

## SETTINGS

One global Settings entry lives in the upper-right OS area, in the same place in Library and Studio.

# Keep MOY64. Give system colors strict jobs.

MOY64 remains the only runtime palette and the portability contract across host, device, web transport, and cartridges. The shell uses a restrained subset; cartridge art may use all 64 colors.

## System subset

Quiet, semantic, consistent. Color tells the user what a control does.

## Cartridge freedom

Games, covers, art, and child-created work remain the richest color on screen.

## Website translation

CSS may use a deeper surround; actual UI screenshots stay faithful to MOY64.

Red is danger/error only. Green is PLAY/healthy state, not decorative branding. Yellow is focus—not a glow effect.

# Pixel-native, not retro.

## Geometry

4px base rhythm; 8px primary layout unit; native 1px borders; square by default; 2-4px corners only where large Library targets benefit.

## Type

Petme128 remains canonical until another bitmap face proves itself on both 320×240 and 1024×600. No antialiased mockup assumptions.

## Icons and Moy

One- or two-color 16×16 system icons. Moy keeps the grape body, dark-purple feet, cream eyes, dark outline, and identity-critical upper-right bite.

## Focus

Yellow border plus shape/state change; always visible without hover. No glow, continuous pulse, or color-only state.

## Surfaces

Warm cream tools over a dark navy construction field. Optional hard 1-2px offset shadow. No blur, glass, or translucency.

## Voice

Short, concrete verbs: PLAY, CHANGE, MAKE, SAVE, LIBRARY. Capable and warm; no baby talk, school scoring, streaks, or engagement language.

The OS is precise. The things children create are expressive.

# Same ideas. Presentation fitted to the device.

320 × 240 · T-DECK

## Fullscreen stack

- Paged Library grid
- Selected PLAY / CHANGE actions
- One responsive Editor tab fullscreen
- Game owns every play frame

1024 × 600 · P4 / HOST

## Windowed Studio

- Large visual Library shelf
- Pinned MAKE entry
- One Make/Editor window
- Playtest beside the Editor
- Taskbar represents real processes

RESPONSIVE · WEB

## Stack or windows

- Same Library and Studio vocabulary
- Viewport chooses presentation
- Real runtime pixels and screenshots
- No separate web-only product model

The large mockups are not downscaled onto the handheld. Layout reflows; behavior stays learned.

# What is locked—and where design work remains.

## Locked direction

- Open Machine identity
- Library / Studio / Player separation
- Library is Home; no persistent bottom nav
- PLAY is primary; CHANGE opens Config
- CHANGE edits the existing project in place
- One upper-right global Settings entry
- MOY64 runtime palette
- Canonical grape Moy
- One tabbed Editor + separate playtest

## Explore and validate

- MAKE versus MAKE STUDIO wording
- Cartridge-cover dimensions and fallback
- Exact 1024×600 density and minimum targets
- Light-surface contrast on the physical P4
- Whether Petme128 is sufficient for dense Studio UI
- Library-to-Studio transition language and motion
- 320×240 Library reflow
- Child comprehension: play, change, create, return
